- [1 Activate](#)
  - [1.1 Entering logfile parameter in Steam](#)
  - [1.2 Entering debug logfile parameter in a link](#)
- [2 Starting LOTUS or the tool](#)
- [3 Find logfile](#)

## 1 Activate

Usually, the debug logfile is deactivated, because LOTUS will be slower with activated logfile. So you have to activate it manually in case of a bug report.

You can activate it like that:

### 1.1 Entering logfile parameter in Steam

1. Click on LOTUS-Simulator (or a tool) in the Steam Library with the right mouse button --> Properties
2. Click "Set start options" --> enter -debuglog.

### 1.2 Entering debug logfile parameter in a link

1. Click onto the program file of LOTUS or a tool (lays in the steam library directory) --> Create link and move it to the prefered place, e.g. the desktop
2. Click right onto the new link --> Properties --> Add - separated with a space - -logfile at the end of the line in "Target"

## 2 Starting LOTUS or the tool

Now you have to restart LOTUS or the tool and try to repeat the error. Then close LOTUS or the tool and...

## 3 Find logfile

...find the logfile. It lays in the logfile directory, too (\Steam\SteamApps\common\LOTUS-Simulator\Logs) and has the same name like the normal logfile. It just has another file extension: \*.ldl instead of \*.txt.

Now just attach it to your post! 😊
